

Quarry as Fence

Concrete fencing gains in popularity annually. It's attractive, adds privacy and will last a lifetime. Columns can be added to Quarry fences to enhance strength and appearance. Once you have installed a Quarry Stone Fence either around your porch or entire back yard, you will be thrilled that it requires no maintenance (neither painting nor replacing boards) to remain beautiful.

When used to build fences, the 4" tall Quarry Stone covers .39 square feet; 2.5 units complete one square foot.

...as retaining wall

The Quarry Stone can be used to build retaining walls, as long as the overall height does not exceed two feet. "Wall batter," (angling the wall into the slope by placing each row 1/2 inch further back than the row underneath) is necessary to stabilize any retaining wall. As the Quarry Stone is rectangular rather than trapezoidal, the wall will benefit from using exterior grade construction glue in-between courses. The square foot coverage is the same as it is for fencing.

By taking our 4" x 8" x 16" Concrete Solid, adding color & tumbling it, we created a rustic look that is sure to remind you of the stone fences in early America and Europe. This "antiqued" block has endless applications. The Quarry Stone builds beautiful retaining walls, majestic stone fences with columns, rustic patios and paths, rugged planters, authentic edging or just about anything you can think of - Quarry Stone does it beautifully.

The dimensions of this stone are 4" tall by 8" wide by 16" long. (As it is a modular unit, the actual dimensions are 3 5/8" by 7 5/8" by 15 5/8".) Quarry Stone has the appearance of natural stone minus the hassle of irregular shapes & inconsistent sizes which occur in nature. Installation is easier & faster.

Quarry as Edger

Quarry makes attractive edging. It can be installed horizontally, as shown in this photo, or vertically with 4" buried for stability and 4" above ground. Each Quarry Stone edger covers 1.33 linear feet. A nice feature about this edging is that 90° corners can be accomplished without cutting block or buying special corner pieces. Quarry is a nice change from conventional edging stones.

Quarry as Patio

Concrete pavers gain in popularity annually. More and more people are switching from poured concrete patios and driveways or wooden decks to the attractive, durable, maintenance-free paving stones. Concrete pavers can "heave" instead of crack like poured concrete does; the problem is either hardly noticeable or can be more easily fixed. Wood decks require annual maintenance and deteriorate anyway.

The Quarry Stone's rustic beauty creates a timeless landscape. Because the Quarry is so versatile, a homeowner can use it to complete most of their landscape projects. Many patios are installed above the grade of the yard and need a retaining wall to raise the patio to the level of the back step. The Quarry Stone can provide the wall and the patio. Another popular addition to a patio is a fence that surrounds. The Quarry Stone can do this beautifully and is sturdy so as to double as a sitting wall and will not be damaged, like wood railing would be, if plants were set on top. As a paver, the Quarry Stone covers .827 of a square foot, meaning 1.21 blocks make up one square foot. Please refer to the description of Quarry as a fence or retaining wall for the square foot coverage for those applications.

Quarry as Steps

Almost all landscape projects involving a patio or a retaining wall can be improved aesthetically and functionally by adding steps. Quarry Stone builds beautiful steps. They are very easy to design and install as the blocks are uniform in their rectangular shape and they allow enough surface area for footing.

Quarry Stone blends in beautifully next to pavers and retaining wall alike. For lasting beauty, Quarry Stone steps will benefit from using exterior-grade construction glue in-between courses when two or more are stacked on each other.
